Quick Start

1. Open PhotoReady on both devices

Open PhotoReady on your iPhone or iPad and PhotoReady on the Mac.

2. Select photos

Choose only the photos you want to send to the Mac.

3. Optionally choose a folder name

Give the transfer a short, recognizable name.

4. Connect to the Mac

Choose the Mac found on the same local network.

5. Send and wait for confirmation

Keep both apps open until the transfer is complete, then verify the photos on the Mac.

Permissions on iPhone and iPad

When you first open the app, iOS may ask for access to Photos and the local network. These permissions are essential.

Photos

Give PhotoReady access to the photos you want to send. With limited access, you will only see photos you previously allowed.

Local Network

This permission is required to find the Mac on the same network.

Selecting photos

Use the photo picker to select one or more photos. Choose only what you actually want to transfer; this keeps the transfer organized.

Choosing a folder name

A recognizable folder name helps you find a photo series later. For example, "Vacation 2026," "Family Day," or "Kitchen Project." Avoid unnecessarily long or complicated names.

Connecting to the Mac

1. Check Wi-Fi

Both devices must be on the same local network.

2. Open PhotoReady on the Mac

The Mac app must be active in order to be found.

3. Choose the Mac

Select the Mac that appears in the mobile app.

4. Check the status

Do not start sending until the app shows that the Mac is connected.

Sending photos

You can follow the progress while sending. Keep the app open and stay connected to the same network until the transfer is complete.

Freeing up space after the transfer

Delete photos only after you have confirmed on the Mac that they were received correctly and stored safely. With iCloud Photos, deleting a photo on one device may also affect the same iCloud photo library on other devices.

Important

PhotoReady for iPhone and iPad works together with PhotoReady for Mac. Without the Mac app, photos cannot be received, organized, and saved through this workflow.

Settings

If you denied a permission, go to Settings → Privacy & Security or to the PhotoReady settings and adjust access.

Guest network

Some guest networks block communication between devices. In that case, use your regular home or business network.

Safest workflow

Verify the photos on the Mac first, and only then delete them from the iPhone or iPad.

Troubleshooting

Problem	Check this
Mac is not found	Same local network; PhotoReady for Mac is open; Local Network access is allowed; no guest network.
Not all photos are visible	Check whether Photos access is limited and, if necessary, allow access to more or all desired photos.
Sending does not start	Selection is ready; Mac is connected; network is active; both apps are open.
Transfer stops	Stay on the same Wi-Fi network, reopen both apps, and reconnect.
Not sure whether to delete	Do not delete anything until you have verified the export on the Mac or SSD.

Support, safety, and copyright

Need help?

Go to nmdapps.com → Support. When contacting support, include the app name, the device you are using, your macOS/iOS/iPadOS version, what you were trying to do, and the full error message. If possible, include a screenshot. Email: support@nmdapps.com

Always keep a backup

After a transfer, conversion, or export, always verify that the new file was saved correctly before deleting the original. For irreplaceable photos and videos, keeping a second backup is recommended.

System requirements

The current minimum system requirements are listed with the relevant app in the App Store. This keeps this guide useful if a later app version requires a newer operating system.
